

DAVID B and the TERRIBLE ROCKS

Written by Christine Smith & Illustrated by Rebecca Rothman

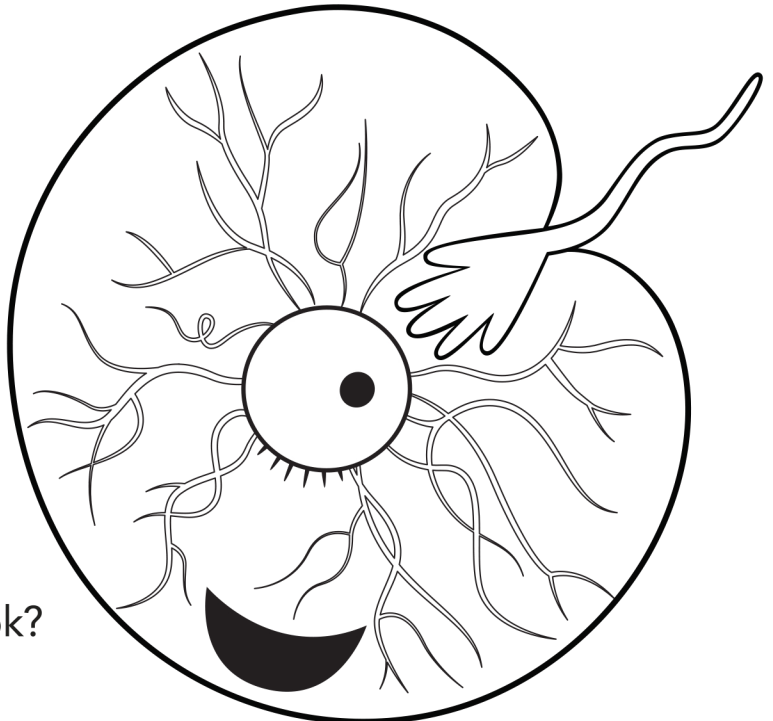

SEA SPARKLES are tiny single-celled organisms

called dinoflagellates. Most dinoflagellates live in the ocean, but some live in fresh water.

Only a few dinoflagellates can make glow-in-the-dark light.

Ceratium sp.

Noctiluca scintillans

Have you seen sea sparkles?

Where do you think you would look?
